

E4RS III / III PLUS - Tip 4: "No Blades" driveshafts

After intensive tests with TM factory drivers, we recommend the use of front driveshafts without plastic blades.

This provides more free movements and increase corner speed.

Contrary to other brands, Team Magic choose to not only remove blades of the standard driveshafts by simply creating smaller outdrives, but we increased pin size from 2mm to 3mm, to avoid any problem of wearing.

So, the Team Magic "no blades" driveshafts are perfectly sized to support high power motors and charges.

Driveshafts with blades (original)

Driveshafts without blades (optional)

3mm pin instead of 2mm for ultra long wear
