

### E4RS II - Tip 9: Battery Holder's Fixations

To prevent any flex interference due to battery holders, especially with the Kfactory optional ones, I recommend to insert small 1mm spacers between chassis and battery holders, and to use 8mm screws instead of the 6mm ones.

This will reduce the contact between the chassis and the battery holder from a large rectangle of 28mm x 6mm (=168mm<sup>2</sup>) to two circles of 28mm<sup>2</sup> each.

Round "feet" will also let more possibilities of movement to the chassis.
