

### Tip 6: Rear Shock Tower

With the original shock tower, it's impossible to obtain a correct ride height with K-Factory or other brands springs.

The minimum ride height with #29 springs (used at Lostallo to obtain the Swiss Championship's TQ) was 7mm !!

So I modified the rear shock tower directly on the track, to create a new hole which allow me to use 5.2mm ride height with any spring I want !

Other holes may be drilled on the same line, to fine tune the shocks position.
